

Think!Cocoa — sales team guide

How to run the demo without a developer. Read sections 1–3 once; keep section 4 open during a call.

1. Signing in

URL	(staging URL — ask Brenda if you don't have it)
Email	project.leader@thinkdata.com
Password	ThinkData2026!

That account sees **all six cooperatives** and every module — what you want in front of a prospect.

Two others, for “what would *my* team see?”:

Account	Shows
buyer@thinkdata.com	A buyer's read-only view
field.officer.aboma@thinkdata.com	One cooperative, field-officer permissions

Same password for every seeded account.

The yellow “**Demo Environment — Not for Production Use**” banner is deliberate, appears on every screen and on every exported document. Leave it on.

2. Getting around

The **cooperative picker** sits in the top bar. Everything you see — lists, dashboards, reports — is scoped to the cooperative selected there. **Aboma Cocoa has the fullest data**; use it unless you have a reason not to.

The **sidebar** groups screens the way the business works:

Group	Screens
Main	Dashboard, Farmers, Farm/Parcel, VSLA
Operations	Training, Coaching
Traceability	Society Purchase, Primary Evacuation, Secondary Evacuation
Compliance	Inspections, CLMRS
Reporting	Reports
Administration	Cooperatives, Users, Roles, Permissions, Data Sync

Every list works the same way. Learn it once:

- **Search** — free text at the top left (name, code, phone...).
- **Filters** — the dropdowns beside it. A filter that's on shows an ✕; click it to clear that one filter. Filters live in the URL, so you can paste a filtered view to a colleague and they see exactly the same rows.
- **Sort** — click a column header; click again to reverse.
- **Row → detail** — click the row. Codes with an open-in arrow jump to that record's own page (farmer → their plots, plot → its farmer).
- **History** — the button at the top right of a list opens the audit trail for that kind of record.

Detail pages all open with a strip of four tiles (the state at a glance), then cards with the full record.

3. Resetting

After a call where you edited, imported or deleted things:

Data Sync → Reset demo data → confirm.

It wipes every operational table and rebuilds the baseline — farmers, plots, EUDR verdicts, inspections, coaching, CLMRS, training, purchases, evacuation, VSLA and the activity feed — then reports what came back. A few seconds. Logins, roles and cooperatives survive; anything deleted during the demo comes back.

Reset **before** a call, not after, so you know what the prospect will see.

Sample import files are in `docs/import-samples/` — farmers, parcels with polygons, EUDR status — for demonstrating bulk import. Reset afterwards.

4. The modules

Dashboard

Four tabs. **Traceability** opens first: purchase volumes, evacuation lots, payment split. Then **Farmers**, **Farms**, **VSLA** — one tab per value proposition, all charts.

Line that works: “Everything you’re about to see rolls up here.”

Farmers

The producer register. The list carries name, society, phone, membership date, **RA Certificate**, CLMRS status and outstanding corrective actions.

- **Certificate validity filter** — **Expiring in 90 days** is the renewals queue. The RA Certificate column shows the expiry with the verdict beside it: green **valid**, amber **in 15d**, red **expired**.
- **A farmer’s page** — tiles for certificate validity, CLMRS, EUDR across their plots, and kilos delivered; then profile, household, RA certificate (number, certifying body, audit date, time left), plots, coaching and CLMRS history.
- **Add Farmer** — the **more** menu (three dots, top right) also holds **Import CSV**, which takes the sample file from `docs/import-samples/`.

Line that works: “One screen per producer, and the registration flow behind it is the same one a field officer uses.”

Farm/Parcel

The land. Plot code, farmer, area, trees, and the three EUDR verdicts — **Deforestation**, **Protected area**, **Overlap** — each filterable.

- **A plot’s page** — the polygon drawn over satellite imagery, with **deforestation patches and protected-area boundaries in red**. Switch the base layer top right if tiles are slow.
- **Import** — GeoJSON polygons and EUDR status CSV, from the samples folder.

Line that works: “This is the EUDR due-diligence question answered per plot, not per shipment.”

Society Purchase → Primary → Secondary Evacuation

The chain of custody, in the order the beans move: bought at the society, trucked to the district warehouse, shipped to port.

On a **Secondary Evacuation** waybill, expand a primary waybill under **Lot composition**: waybill → purchases → farmers → plots. Purchase IDs and waybill numbers are links, so you can walk the chain in both directions. Unresolved links are flagged with an amber count rather than hidden.

Line that works: “Full traceability both ways, and it tells you where the data is incomplete instead of pretending it isn’t.”

VSLA

Savings groups. Group list with members, cumulative savings and loan status; a group's page shows the savings cycle and a **member ledger** — each farmer's balance and loan history.

CLMRS

Child-labour monitoring. Households assessed, risk classification, and remediation cases linked to the flagged household. The Farmers list has a CLMRS column so you can pivot from a producer to their case.

Training · Coaching · Inspections

Field activity: sessions and attendance, coaching visits, and the inspections that produce the certification outcome and corrective actions.

Reports

Seven templates: EUDR Compliance, Certification Status, Corrective Actions, Farmer Coaching, Group Member Registry, Traceability, Training Attendance.

Pick a report, set the date range (and society, if asked), choose **XLSX** or **CSV**, then **Run**. It appears in the run list within a few seconds — download it and open it in front of them.

Notifications (the bell, top right)

Every change in the system: who, what, when, and the field-by-field diff. Filter by user or record with the arrow button that appears on hover. Auditors ask about this.

Administration

Cooperatives, users, roles and permissions — worth opening if a prospect asks “who can see what?”. Roles are editable and permissions are per-resource. **Data Sync** is also where the reset lives.

5. A ten-minute run

Dashboard → Farmers (filter **Expiring in 90 days**, open a farmer) → Farm/Parcel (open a plot, show the map layers) → Secondary Evacuation (expand a lot) → VSLA (a group's members) → CLMRS → Reports (run EUDR Compliance, download) → Notifications.

6. If something looks wrong

Symptom	Do this
Sent back to the login screen	Sign in again. If it repeats, tell the dev team — don't demo through it.
A screen is empty	Check the cooperative picker; you may be on a coop with little data. Try Aboma Cocoa .
A list looks wrong	Check for an active filter — a filter chip with an ✕ — and clear it.
Data looks edited or deleted	Reset demo data (section 3).
Map tiles don't load	Network. Switch the layer control to Open Street Map.
A report won't download	Re-run it; if it fails twice, tell the dev team.

Anything else: Brenda, brenda@thinkdataservices.com.

7. Questions you'll get

- **“Is this real data?”** No. Every farmer, plot, coordinate and transaction is synthetic, generated for this demo. No client data is in it.
- **“Can we get a copy?”** It's a hosted demo. Deploying against a prospect's own data is a separate conversation with the team.
- **“Can I click around myself?”** Yes — that's what the reset is for.
- **“Does it work on my phone?”** It's built for a laptop browser. Screens reflow on a tablet; the maps and wide tables want a real screen.
